**CETENA**

**MIMOS**

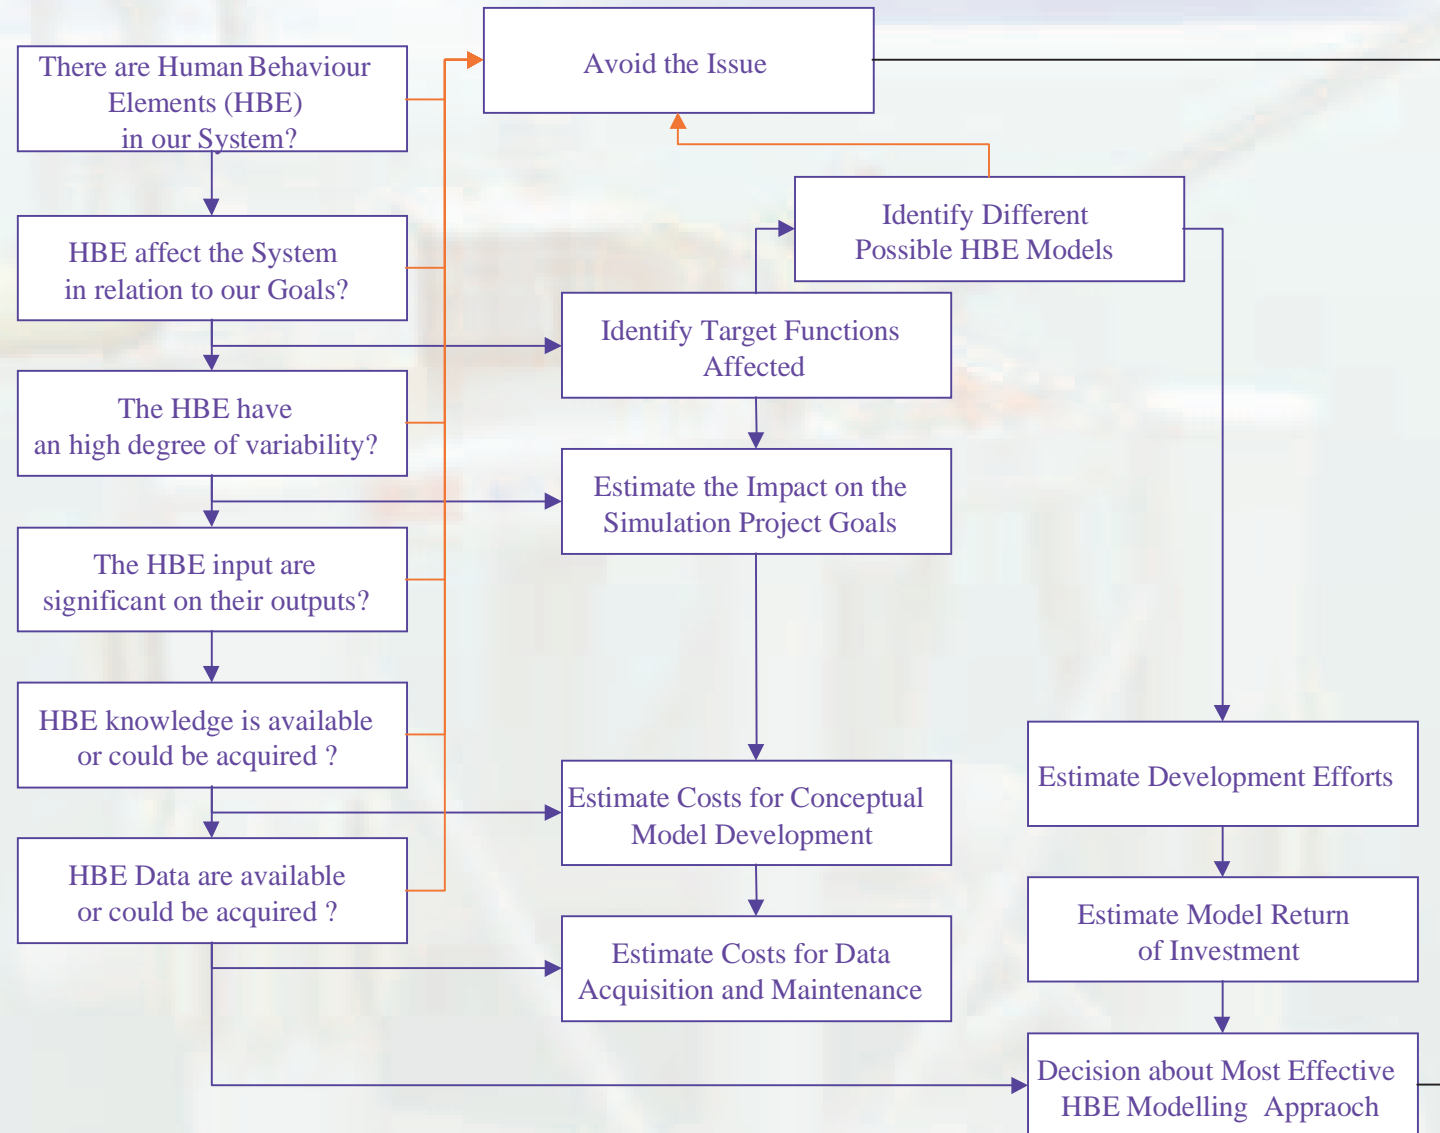

# Goals

- Estimation of Effectiveness in using Modeling & Simulation, Computer Graphic & Virtual Reality in Platform Organization and Operative Procedures
- Development of a Case Study Combining the different techniques (M&S, CG, VR)
- Validation & Verification over the developed Models
- To Estimate the impact of these integrated Systems as support for SBDVP (Simulation Based Design & Virtual Prototype)

# Modelling Humans

# Vessel Micrologistics

New Technologies and Procedures allows today to reorganize Processes and Logical Operations

- Automation and/or Process Changes
- People/Cargo Movements
- Space Reallocations

Only SBDVP supports effectively on-board implementation of these new approaches by estimating peculiarities:

- Limited/Multifunctional Space
- People Polyfunctional Roles
- Different Operative Conditions
- Sea Operations 365/24

These additional modelling efforts are balanced by improvements in:

**Cost Reduction**  
**Higher Operative Effectiveness**  
**On-Board Quality of Life**

# Examples of Experiences

VR for ergonomic design of control room on Oil Platforms - Petrobras

M&S for Operative reorganization of Logistics and Handling Procedures on LPD17 - US Navy

M&S for polyfunctional automation in crew role assignment on DD21 - US Navy

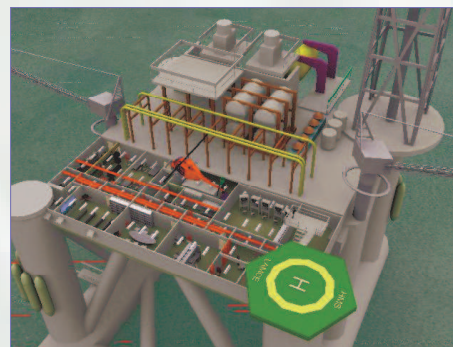

# Example: Quality of Life in Oil Platforms

In Vessels and Oil Platform it is possible by modelling re-engineering the space allocation;

This allows to reduce drastically personnel, increasing the living spaces and providing more support to other services (i.e. fuel, weapons etc.)

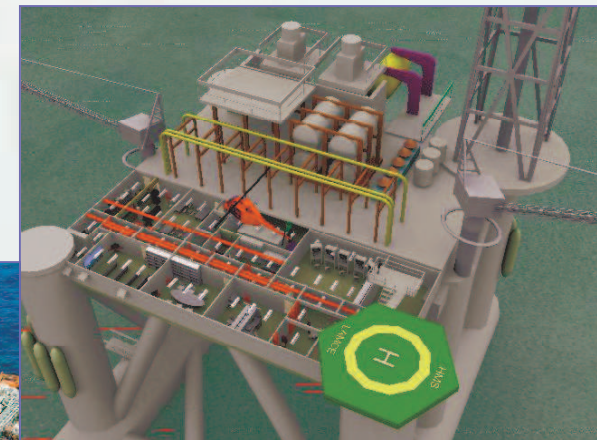

# Preliminary Analysis

By the support of existing cooperations it was possible to develop Computer Graphics systems for a feasibility study related to:

- People Activity
- Platform Layout
- Operations & Functions

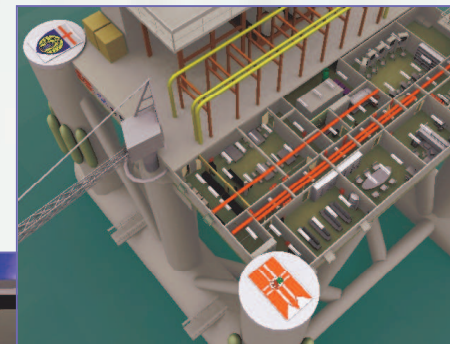

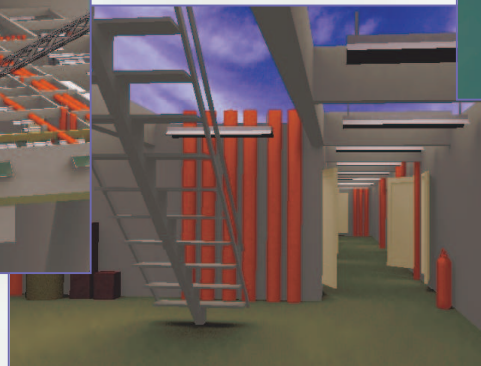

# *Placra Model:* Oil Platform

The *Placra* (Platform Crew Animation) model was developed in CG in order to reproduce the crew activities on Oil Platform from Petrobras. *Placra* simulates crew movements generated by functional requirements (3D Motion, MultiLayer and infrastructure operations)

VRJuggler  
WXWindows  
3DSMax

OpenSceneGraph  
Sonix

# Sistema *Similo*: Crew Mensa

The simulator ***Similo*** (Ship MicroLogistics), is an integrated approach to M&S and CG devoted to support on-board plants and processes; in this case the study focused on the crew mensa (cook-room) in development by CETENA/Fincantieri.

***Similo*** model the interaction among people and his behaviour in order to estimate support performance analysis (i.e. evaluation of external catering as substitute of kitchens in Fast Ferries).

# Conceptual Model

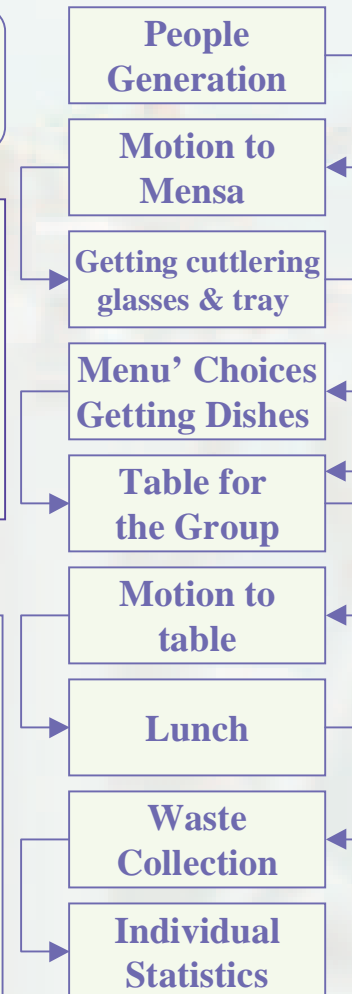

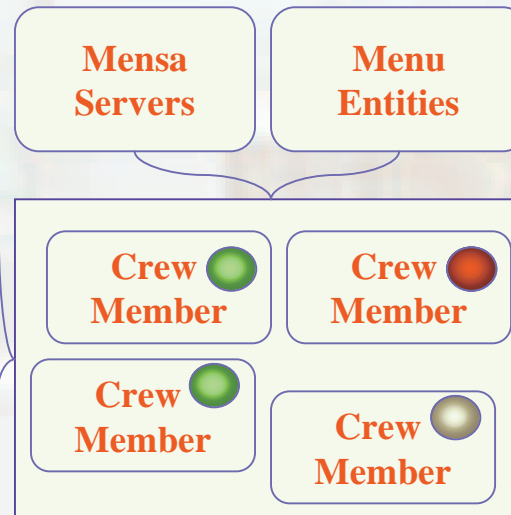

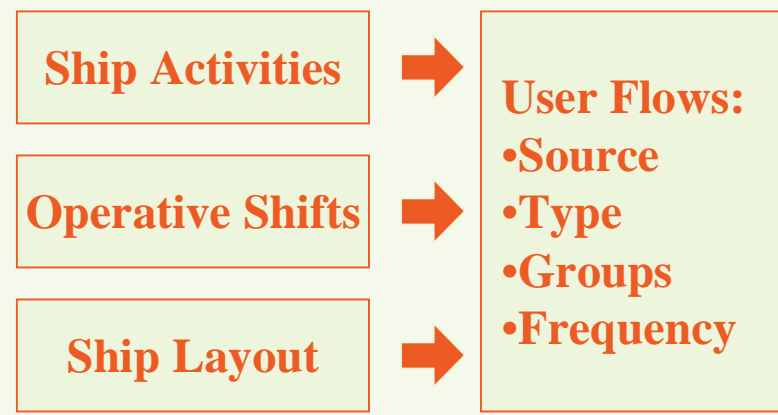

Path

Layout

Generators

Stochastic Model based on Combined Simulation and Object Oriented Analysis e Design

- Discrete Events: Operations and Actions
- Continuous Motion and People Interactions

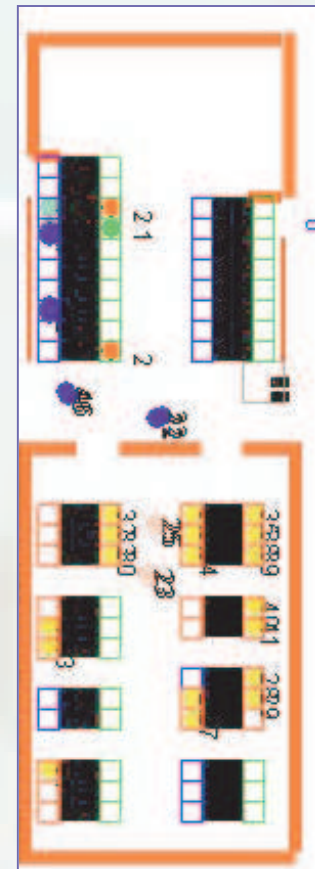

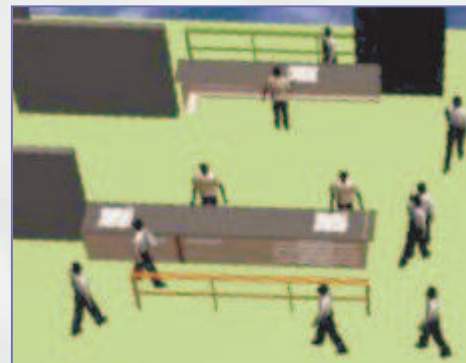

# People Dynamics

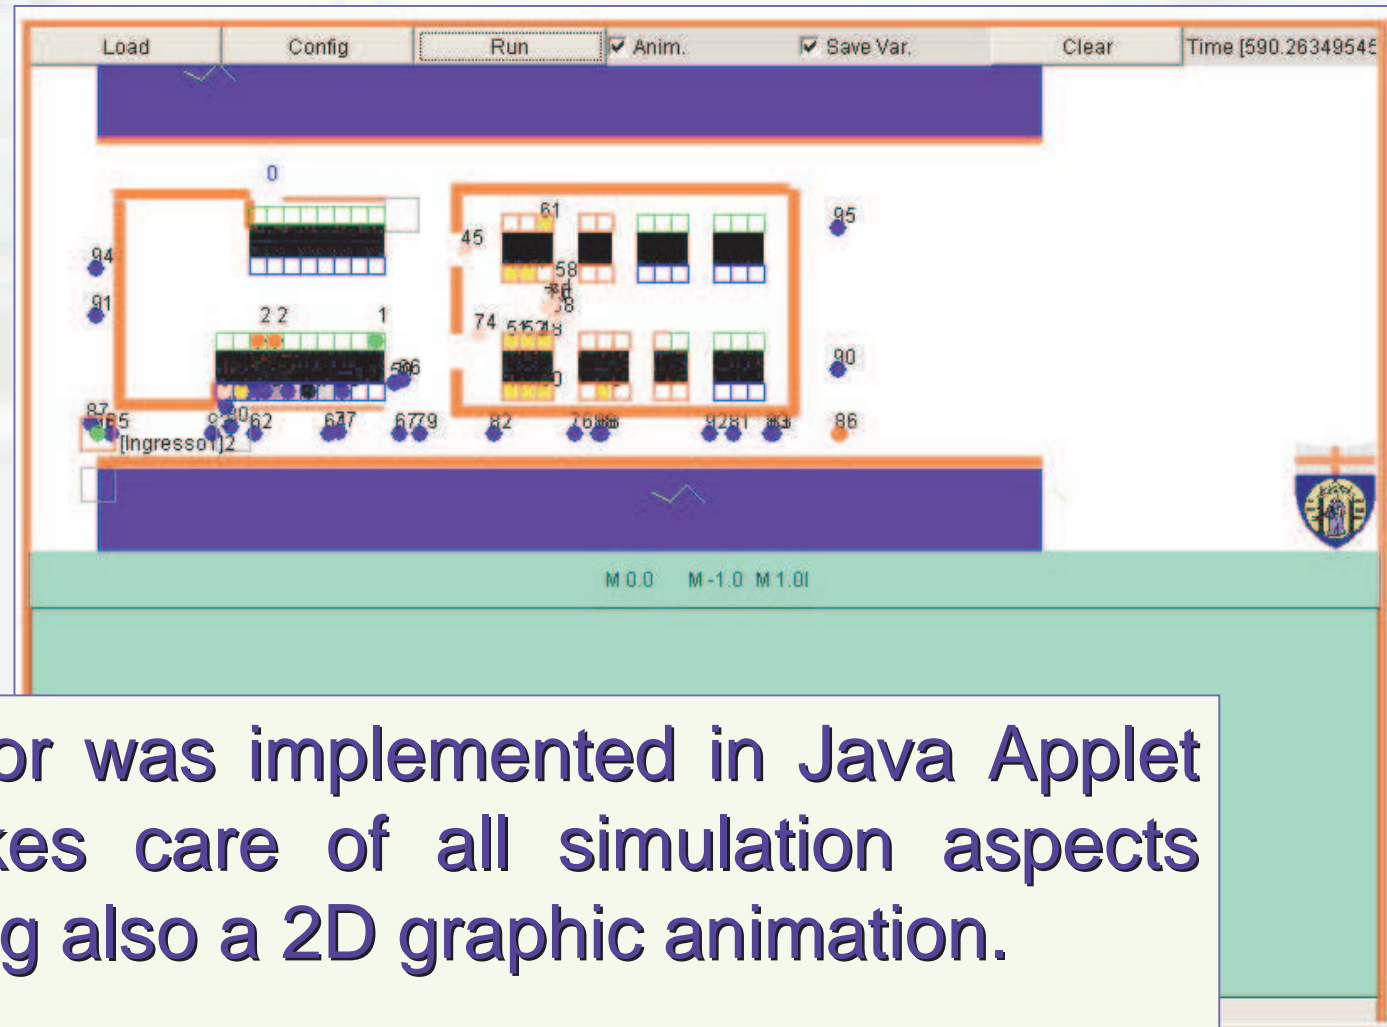

People dynamics involves the following phenomena:

- Personnel Grouping
- Dividing Group if necessary
- Task, Operation Locations and Reference Path
- Avoiding fixed and mobile Obstacles
- Avoiding People

# Simulator: *Similo*

Simulator was implemented in Java Applet and takes care of all simulation aspects providing also a 2D graphic animation.

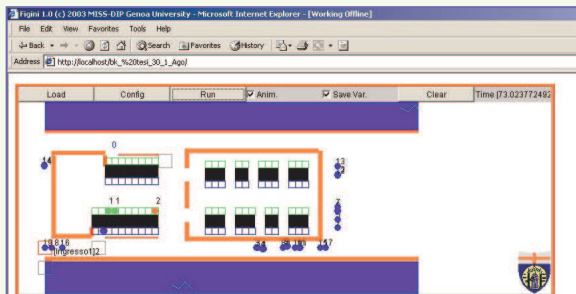

# Global Architecture

## Simulator

- Java Based and Platform Independent(es.: Windows, Unix)
- Web integrated
- Highly Customizable and Modular Approach
- Integrated with 2D Fast-Time, CG 3D Post Processing and DOE/RSM Output

## Postprocessor

- More Realistic Visualization
- Better “insight” on the Model
- Support for VV&A

## Decision maker

- Synthetic Data and Information
- “high-level” Phenomena Perception
- Cross-check for Macro Critical Component Identification

## DOE, RSM

- Parameter Analysis
- Target Function Analysis and Run
- High Computing Performance

## Analyst

- Full Data Required (i.e.: tables and DBases)
- Compatible output with Analysis Packages

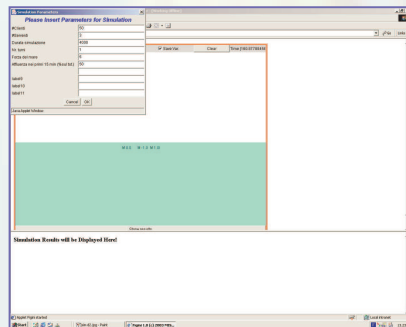

# 3D Post-Processing

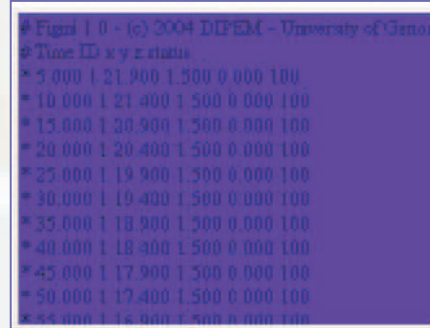

Post Processing 3D is based on:

*Java Applet*

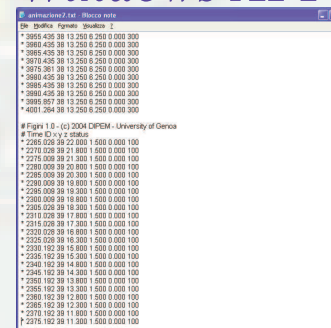

*Simulator I/O*

*JavaScript*

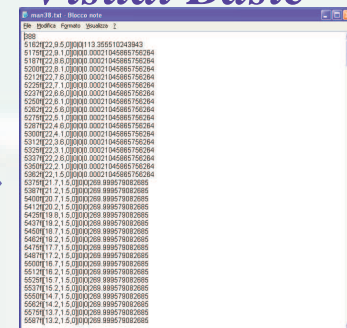

*HTML*

*Windows API*

*ASCII*

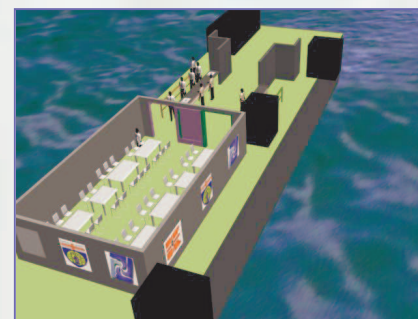

*Visual Basic*

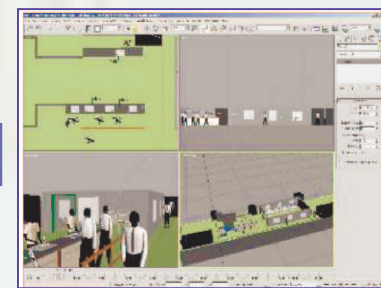

*ASCII*

*MaxScript*

Simulation operates in Applet Java exporting data on the same HTML page; this allows remote user to generate a database for 3D rendering

*AVI/MOV*

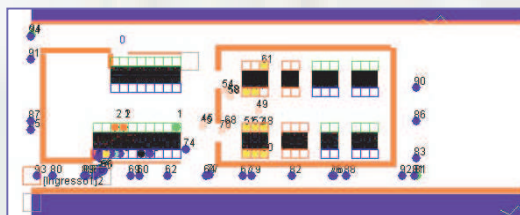

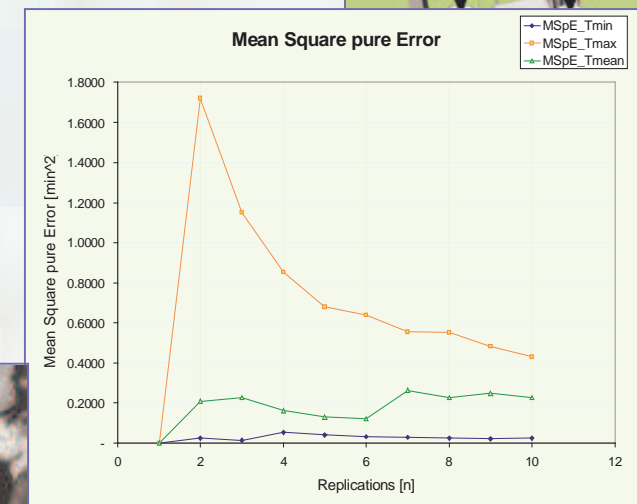

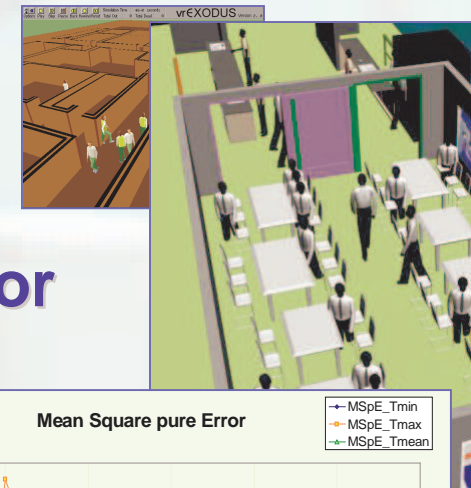

*3DS Max*

# VV&A

Model VV&A was based on the following techniques:

- Simulator White Box Tracking
- 2D Animations Check on Simulator
- 3D Animations Check on Post-Processor
- Black Box Analysis on Results
- MSpE Temporal Evolution
- Comparison with Other Models (i.e.Exodus)
- Comparison with Real Data

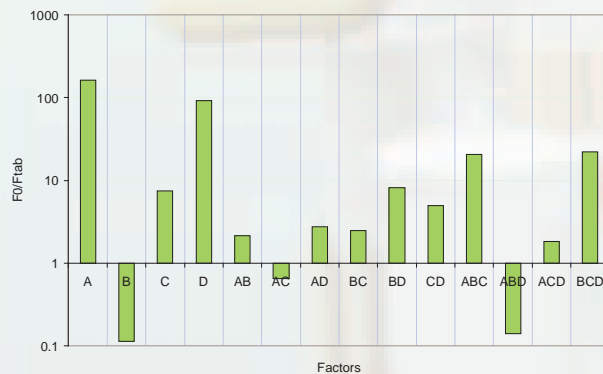

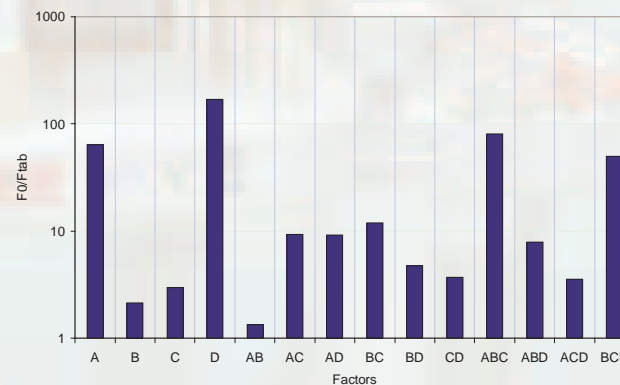

# Sensitivity Analysis

Sensitivity Analysis allowed to correlate factors and parameters with target functions

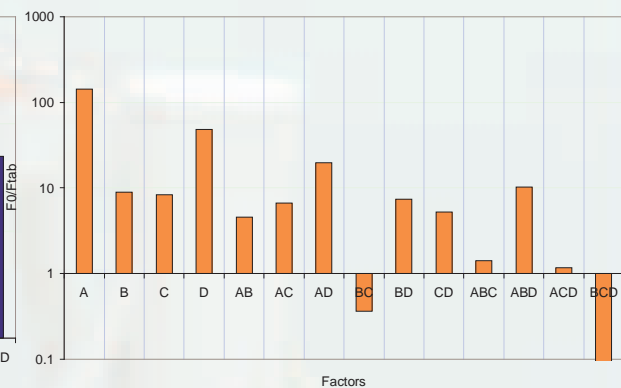

Sensitivity Analysis TMean

Sensitivity Analysis Tmin

Sensitivity Analysis Tmax

The experimental analysis was focusing on lead times (average, minimum, maximum) by a Composite Central Design 2<sup>4</sup>

Level	Low	Mean	High
A (Crew)	40	50	60
B (Servers)	1	2	3
C (Initial Arrival Rate)	30	50	70
D (Sea Factor)	3	5	7

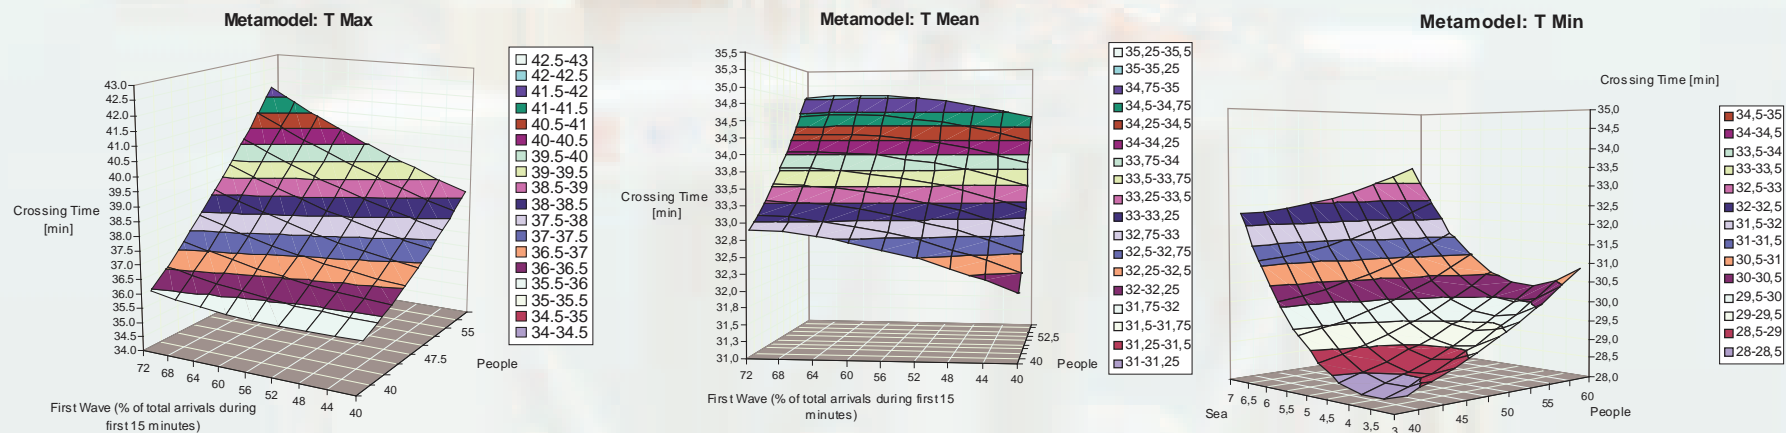

# Response Surface

# Methodology & SBDVP

By RSM methodology it was possible to support Virtual Prototype of new mensa

Metamodels based on sul CCD (Central Composite Design) have been statistical validated

# Conclusions

- It was possible to verify the effectiveness of the proposed approach on Complex Cases
- The Case study allowed to evaluate the costs/benefits related to this application area
- Similo simulator is a good reference for the development of new SBDVP tools for Cook-Rooms in vessels and other on-board processes
